

**Exercise 1.1.2**

Suppose  $(X, f)$  is a factor of  $(Y, g)$  by a semi-conjugacy  $\pi: Y \rightarrow X$ . (1)

Show that if  $y \in Y$  is a periodic point, then  $\pi(y) \in X$  is periodic. (2)

Give an example to show that the preimage of a periodic point does not necessarily contain a periodic point. (3)

**Proof + reasoning:**

Let's start with (2). (4)

Let  $y \in Y$  be periodic. (5)

We can just write out the definitions and see if the correct answer follows. (6)

$$f(\pi(y)) = \pi(g(y)) = \pi(y). \quad (7)$$

So, (2) follows from (7). (8)

Now, we want to construct a counterexample. Let's think of any semi-conjugacy and iterate from there. An obvious example is a projection. (9)

Let  $A$  and  $B$  be sets, and  $\pi_A: A \times B \rightarrow A$  the projection. (10)

For all  $\alpha$  and  $\beta$ , the following diagram commutes:

$$\begin{array}{ccc} A \times B & \xrightarrow{\alpha \times \beta} & A \times B \\ \downarrow \pi_A & & \downarrow \pi_A \\ A & \xrightarrow{\alpha} & A \end{array} \quad (11)$$

Intuitively, by taking projections, we 'forget' about the effect of  $\beta$ . So, we can simply choose  $\beta$  such that all points in  $A \times B$  are non-periodic with respect to  $\beta$ , while choosing  $\alpha$  so that all points in  $A$  are periodic with respect to  $\alpha$ . (12)

Let  $A$  be any set,  $B = [0, 1]$ ,  $\alpha = \text{id}_A$  and  $\beta: (x \mapsto \frac{1}{2}x)$  (13)

Wait, 0 is still a periodic point in the example above. Let's modify it. (14)

Let  $A$  be any set,  $B = (0, 1]$ ,  $\alpha = \text{id}_A$  and  $\beta: (x \mapsto \frac{1}{2}x)$  (15)

Clearly,  $\beta$  has no periodic points, so  $\alpha \times \beta$  has no periodic points, but all points in  $A$  are periodic with respect to  $\alpha$ . (16)

By (16), (3) follows. (17)
